

Task 1.

Create a web site for your family business (you can choose anything: coffee shop, mobile phone service, clothes alteration ...). Use a web template with following sections: Header, Navigation, Dynamic Content, and Footer.

Create two versions of this task. Once do this task by having Button navigation, and once having the Hyperlink navigation.

Task 2.

Create a website that will allow a user to save work tasks in text files.

The work task includes information as name and id number, description, priority (low/high), notes (additional information or problems), status (new/in progress/completed).

The main page should include links as: list all tasks (in a table including links for opening files), create a new task, update an existing task.

Notes: Ensure that the project directory/files have read and write permissions for everyone

Task 3.

Create a Web form for uploading pictures for a “Pet shop”. The form should have input fields for the pet’s name and a description of the image, and a file input field for the image. To accompany each image file, create a text file that contains the name and description of the image. Create a separate Web page that displays the pictures with a caption showing the name and description fields.

Notes: Ensure that the project directory/files has read and write permissions for everyone

Task 4.

Create a document with a form that registers bowlers for a bowling tournament. Use a single text file that saves information for each bowler (name, age, and average) on a separate line. It is not allowed to insert the same bowler (same name and surname) twice.

Notes: Ensure that the Projects directory has read and write permissions for everyone
